

now what?

connect and display today's digital sources

Today, digital HD is the standard both at home and in the office. The latest laptops and HD video conferencing systems only feature HDMI/DVI outputs, and MacBooks® only have a mini DisplayPort out. Clients want the best quality HD signal, and they expect to be able to walk into a room and plug-in their laptops digitally. Crestron DigitalMedia™ is the only complete source to display solution, managing and distributing all analog and digital signals over a single copper wire or fiber strand. And only DM provides a seamless upgrade path from analog to digital without replacing existing hardware.
