

iTunes® + iPod® + Crestron = iServer™

Practically everyone today downloads their favorite music from iTunes and stores it on an iPod. Now, for the first time, you can turn your personal iPod into a dedicated home entertainment system.

Why waste time and money on traditional hard drive servers that can't store or play iTunes without cumbersome file processing and transferring? Why sit in silence because someone left the house with the iPod? Why undock your iPod and run to the computer to update with iTunes?

Crestron iServer™ uses a permanently installed iPod as its hard drive, and connects to the home computer network via Ethernet. Exclusive, built-in technology transmits Apple® USB over Ethernet so the iServer automatically synchronizes with your iTunes library whenever new content is downloaded or new playlists are created.

Finally, there's an elegant way to turn your iPod into a true home audio server without the hassles of transcoding, manually synchronizing or searching for your iPod like a set of lost keys.

Crestron iServer isn't just iTunes compatible; it is iTunes – served up in every room of the house.

Crestron iServer™
