Statement of Volatility

Approved 19 October 2026

Crestron devices may contain Volatile and/or Non-Volatile memory. The purpose of this document is to provide

The following products are covered by this statement.

- SKU:IV-CAM-I12D-B
- Model: M202306005

Type	Size	V/NV	Usage	User Data	Clearing Process	Notes
FLASH	2Gb	NV	User Configuration System Configuration Software Image Log Files	Diagnostic Configuration	See Clearing Instructions below.	Works with audio algorithm SOC
EMMC	8Gb	NV	User Configuration System Configuration Software Image Log Files	Diagnostic Configuration	See Clearing Instructions below.	Works with main SOC
SDRAM	8Gb (4GbX2)	V	saves different data, after camera is powered off, data lost	End User Configuration	Remove power from device.	Works with main SOC

End User Data Description

None

Clearing Instructions

Configuration data may be cleared via Restore To Factory Defaults command. Diagnostics and event logs may also be cleared manually.

Please see product documentation for additional details on performing operations.

For additional questions, please contact your sales or support team.

Terms and Definitions

Volatile Memory (V) requires power to maintain the stored information. When power is removed from this memory, its contents are lost.

Non-Volatile Memory (NV) does not require power to maintain the stored information. Device retains its contents when power is removed.

End User Data refers to any information which a user is capable of inputting to the device, directly or indirectly in a normal day-to-day usage scenario.

Configuration Data refers to any information input to the device by an administrator. This may include network and service configuration or custom programming.

Diagnostic Data refers to system log files and similarly created data which may be accessed by an administrator to verify the correct operation of the device or provide troubleshooting.

Clearing is defined by NIST Special Publication 800-88 Revision 1, as a logical technique to sanitize data for protection against simple non-invasive data recovery techniques using the same interface available to the user.

Sanitization is defined by NIST Special Publication 800-88 Revision 1, as a process to render access to "User Data" on the media infeasible for a given level of effort. In this document, Clearing is the degree of sanitization described.
